Instructor:	Dr. Katherine Evans
Class:	Linear Algebra and Differential Equations
Time:	Monday, Wednesday, Friday 12:00PM - 1:00PM

1.4 Separable Differential Equations

Definition 1.4.1: A first-order differential equation is called separable if it can be written in the form

$$p(y) \cdot \frac{dy}{dx} = q(x)$$

1.4.2 Theorem:

If p(y) and q(x) are continuous, then Equation (1.4.1) has the general solution

$$\int q(y) \cdot dy = \int p(x) \cdot dx + c$$

where c is an arbitrary constant.
[2-3 examples]

1.8 Homogeneous first-order DE's

1.8.1 Definition:

A function is homogeneous of degree zero if

$$f(tx, ty) = f(x, y)$$

for all positive values of t for which (tx, ty) is in the domain of f.

1.8.3 Theorem:

A function $f(x, y)$ is homogeneous of degree zero if and only if it depends on the ratio of $\frac{y}{x}$ or $\frac{x}{y}$ only.

1.8.4 Definition:

If $f(x,y)$ is homogeneous of degree zero, then the differential equation

$$\frac{dy}{dx} = f(x,y)$$

is called a homogeneous first-order differential equation.

1.8.5 Theorem:

The change of variables $y = x \cdot V(x)$ reduces a homogeneous first-order differential equation $\frac{dy}{dx} = f(x,y)$ to the separable equation

$$\frac{1}{F(V) - V} \cdot dV = \frac{1}{x} \cdot dx$$

Form of a First-Order Homogenous Differential Equation

$$\frac{dy}{dx} = F(\frac{y}{x})$$

Steps in solving a First-Order Homogenous DE

1. perform substitution: $v = \frac{y}{x} \rightarrow y = x \cdot v$ and $\frac{y}{x} = x \cdot \frac{dv}{dx} + v$
2. Solve the differential equation using separation of variables
3. Solve the original differential equation in terms of x and y

[2-3 examples]
Determine if the following equation is homogeneous. If it is homogeneous, then solve.

$$\frac{dy}{dx} = \frac{3y^2 + xy}{x^2}$$

Multiplying both the numerator and the denominator by $\frac{1}{x^2}$ results in:

$$\frac{dy}{dx} = 3(\frac{y}{x})^2 + \frac{y}{x}$$

Which is in the form of:

$$\frac{dy}{dx} = F(\frac{y}{x})$$

Using our substitutions:

$$v = \frac{y}{x}$$
$$\frac{dy}{dx} = x\frac{dv}{dx} + v$$

We obtain:

$$x \cdot \frac{dv}{dx} + v = 3v^2 + v$$
$$x \cdot \frac{dv}{dx} = 3v^2$$

Rearrange to solve using separable DE method

$$\frac{1}{3v^2} \cdot dv = \frac{1}{x} \cdot dx$$
$$\frac{1}{3}v^{-2} \cdot dv = \frac{1}{x} \cdot dx$$
$$\int \frac{1}{3}v^{-2} \cdot dv = \int \frac{1}{x} \cdot dx$$
$$-\frac{1}{3}v^{-1} = ln \mid x \mid +C$$

Now aquire the equation in terms of x and y with our substitution ratios

$$-\frac{1}{3}v^{-1} = ln \mid x \mid +C$$
$$-\frac{1}{3}(\frac{y}{x})^{-1} = ln \mid x \mid +C$$
$$-\frac{1}{3}(\frac{x}{y}) = ln \mid x \mid +C$$
$$-\frac{1}{3}(\frac{x}{y}) = ln \mid x \mid +C$$
$$\frac{x}{y} = -3(ln \mid x \mid +C)$$
$$\frac{x}{y} = \frac{-3(ln \mid x \mid +C)}{1}$$
$$\frac{y}{x} = \frac{1}{-3(ln \mid x \mid +C)}$$
$$y = \frac{x}{-3(ln \mid x \mid +C)}$$
